Future Circular Collider Study - Scope:

International FCC collaboration (CERN as host lab) to study:

- pp -collider (*FCC-hh*)
→ long-term goal, defining infrastructure requirements

~16 T \Rightarrow 100 TeV pp in 100 km

- ~100 km tunnel infrastructure in Geneva area, site specific
- e^+e^- collider (*FCC-ee*), as potential first step
- HE-LHC with *FCC-hh* technology
- $p-e$ (*FCC-he*) option, IP integration, e^- from ERL

FCC study: physics and performance targets

FCC-ee:

- Exploration of 10 to 100 TeV energy scale via couplings with precision measurements
- ~20-50 fold improved precision on many EW quantities (equiv. to factor 5-7 in mass) (m_Z , m_W , m_{top} , $\sin^2 \theta_w^{\text{eff}}$, R_b , $\alpha_{\text{QED}}(m_Z)$, $\alpha_s(m_Z)$, $m_Z m_W m_\tau$), Higgs and top quark couplings)
- Machine design for highest possible luminosities at Z, WW, ZH and ttbar working points

FCC-hh:

- Highest center of mass energy for direct production up to 20 - 30 TeV
- Huge production rates for single and multiple production of SM bosons (H,W,Z) and quarks
- Machine design for 100 TeV c.m. energy & integrated luminosity $\sim 20\text{ab}^{-1}$ within 25 years

HE-LHC:

- Doubling LHC collision energy with FCC-hh 16 T magnet technology
- c.m. energy $\sim 27\text{ TeV} = 14\text{ TeV} \times 16\text{ T}/8.33\text{ T}$, target luminosity $\geq 4 \times \text{HL-LHC}$
- Machine design within constraints from LHC CE and based on HL-LHC and FCC technologies

FCC-ee basic design choices

- **Double ring e+ e- collider** ~100 km
- **Follows footprint of FCC-hh**, except around IPs
- **Asymmetric IR layout and optics** to limit synchrotron radiation towards the detector
- **2 IPs**, large horizontal crossing angle **30 mrad**, **crab-waist optics**
- **Synchrotron radiation power 50 MW/beam** at all beam energies
- **Top-up injection** scheme for high luminosity
- Requires **booster synchrotron in collider tunnel**

FCC-ee collider parameters

parameter	Z	WW	H (ZH)	ttbar
beam energy [GeV]	45	80	120	182.5
beam current [mA]	1390	147	29	5.4
no. bunches/beam	16640	2000	393	48
bunch intensity [10^{11}]	1.7	1.5	1.5	2.3
SR energy loss / turn [GeV]	0.036	0.34	1.72	9.21
total RF voltage [GV]	0.1	0.44	2.0	10.9
long. damping time [turns]	1281	235	70	20
horizontal beta* [m]	0.15	0.2	0.3	1
vertical beta* [mm]	0.8	1	1	1.6
horiz. geometric emittance [nm]	0.27	0.28	0.63	1.46
vert. geom. emittance [pm]	1.0	1.7	1.3	2.9
bunch length with SR / BS [mm]	3.5 / 12.1	3.0 / 6.0	3.3 / 5.3	2.0 / 2.5
luminosity per IP [$10^{34} \text{ cm}^{-2}\text{s}^{-1}$]	>200	>25	>7	>1.4
beam lifetime rad Bhabha / BS [min]	68 / >200	49 / >1000	38 / 18	40 / 18

Lepton collider luminosities

total
luminosity
[$10^{34} \text{ cm}^{-2}\text{s}^{-1}$]

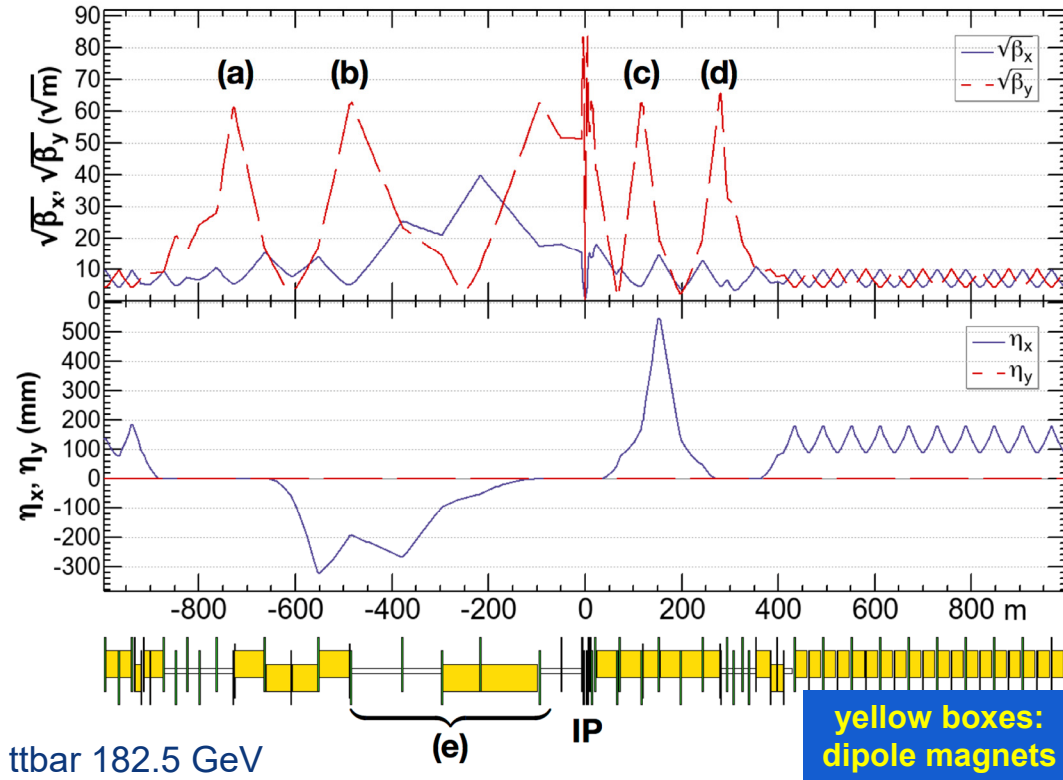

1000

100

10

1

- **Asymmetric IR optics** to suppress synchrotron radiation toward the IP, $E_{\text{critical}} < 100 \text{ keV}$ from 450 m from IP (e)
- **4 sextupoles (a – d)** for local vertical chromaticity correction combined with crab waist, optimized for each working point.
- **Common arc lattice** for all energies, 60 deg for Z, W and 90 deg for ZH, tt for maximum stability and luminosity

FCC-ee operation model

working point	luminosity/IP [$10^{34} \text{ cm}^{-2}\text{s}^{-1}$]	total luminosity (2 IPs)/ yr	physics goal	run time [years]
Z first 2 years	100	26 $\text{ab}^{-1}/\text{year}$	150 ab^{-1}	4
Z later	200	52 $\text{ab}^{-1}/\text{year}$		
W	25	7 $\text{ab}^{-1}/\text{year}$	10 ab^{-1}	1
H	7.0	1.8 $\text{ab}^{-1}/\text{year}$	5 ab^{-1}	3
machine modification for RF installation & rearrangement: 1 year				
top 1st year (350 GeV)	0.8	0.2 $\text{ab}^{-1}/\text{year}$	0.2 ab^{-1}	1
top later (365 GeV)	1.4	0.36 $\text{ab}^{-1}/\text{year}$	1.5 ab^{-1}	4

total program duration: 14 years - including machine modifications

phase 1 (Z, W, H): 8 years, phase 2 (top): 6 years

FCC-ee RF staging scenario

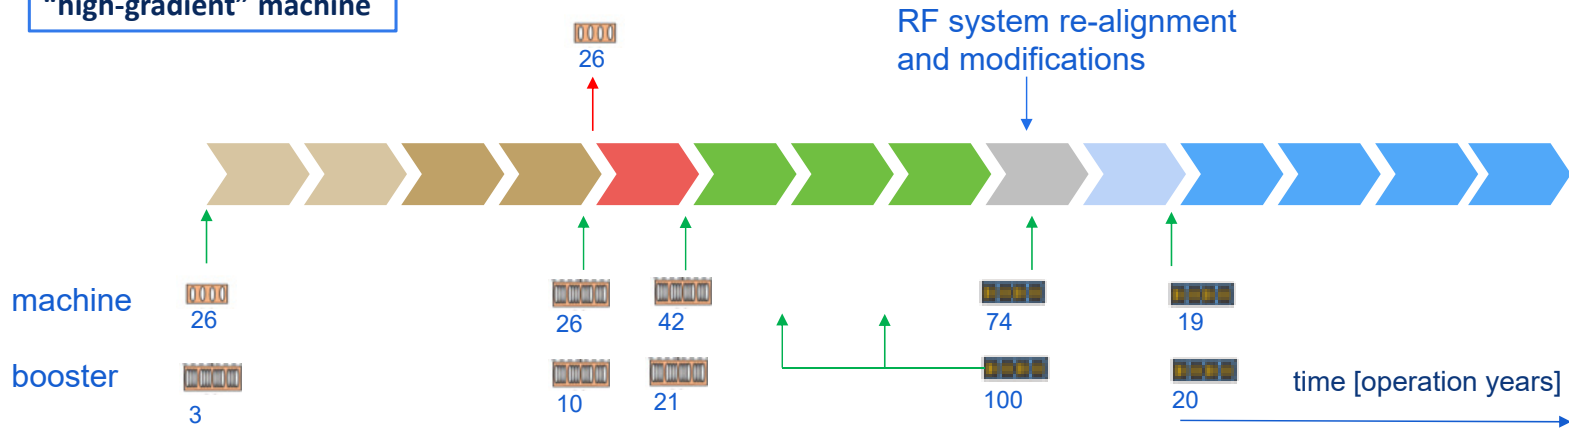

“Ampere-class” machine

WP	V_{rf} [GV]	#bunches	I_{beam} [mA]
Z	0.1	16640	1390
W	0.44	2000	147
H	2.0	393	29
ttbar	10.9	48	5.4

“high-gradient” machine

three sets of RF cavities to cover all options for FCC-ee & booster:

- high intensity (Z, FCC-hh): **400 MHz mono-cell cavities (4/cryom.)**
- higher energy (W, H, t): **400 MHz four-cell cavities (4/cryomodule)**
- ttbar machine complement: **800 MHz five-cell cavities (4/cryom.)**
- installation sequence comparable to LEP (≈ 30 CM/shutdown)

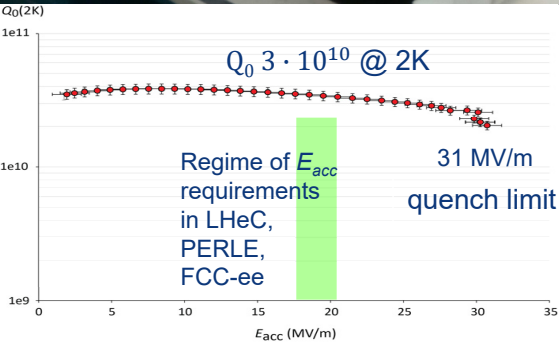

SRF cavity development program (examples)

5-cell 800 MHz cavity, JLAB prototype for both FCC-ee (t-tbar) & FCC-eh ERL (PERLE)

JLAB, Oct 25, 2017 F. Marhäuser et al

Seamless 400 MHz single-cell cavity formed by spinning at INFN-LNL

Tooling fabricated and successfully tested with an Aluminium cavity.

† We're saddened about the sudden death of Vincenzo Palmieri few weeks ago.

CERN half-cells formed using Electro-Hydro-Forming (EHF) at Bmax.

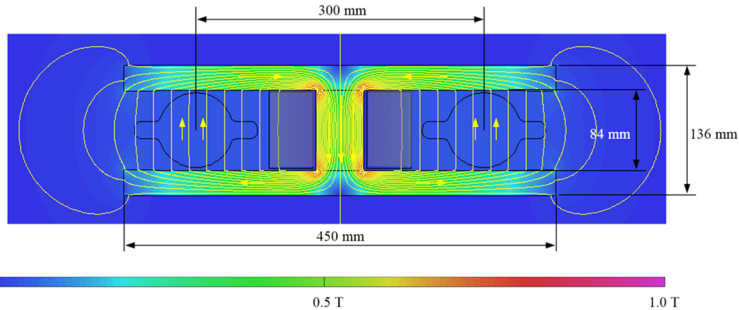

J.-F. Croteau, EASITrain PhD Student

High strain rate technology using shockwaves in water from HV discharge. EHF investigated for half-cells and seamless Nb and Cu cavities.

Low-power low-cost design for FCC-ee magnets

Twin-dipole design with 2× power saving
16 MW (at 175 GeV), with Al busbars

first 1 m prototype

twin F/D quad design with 2× power saving
25 MW (at 175 GeV), with Cu conductor

first 1 m prototype

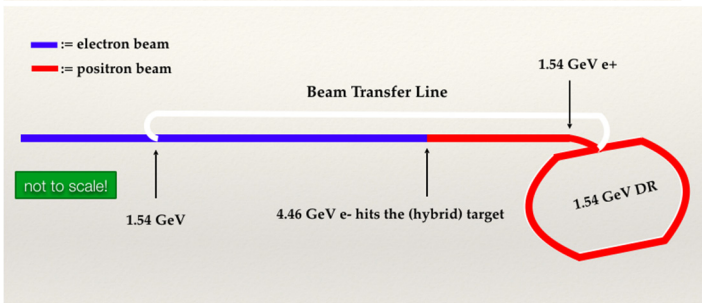

Vacuum chamber cross section:
70 mm ID with "winglets" in the plane
of the orbit (SuperKEKB-like);

- The chambers feature **lumped SR absorbers with NEG-pumps** placed next to them.
- **Construction of chamber prototypes in coming months and integration with twin magnets**

FCC-ee injector layout

- SLC/SUPERKEKB-like 6 GeV linac accelerating 1 or 2 bunches with repetition rate of **100-200 Hz**
- **Same linac** used for positron production @ **4.46 GeV**
Positron beam emittances reduced in DR @ **1.54 GeV**
- Injection @ **6 GeV** into of Pre-Booster Ring (SPS or new ring) and acceleration to 20 GeV
- Injection to main Booster @ **20 GeV** and interleaved filling of e⁺/e⁻ (below **20 min** for full filling) and continuous top-up

FCC-pp collider parameters

parameter	FCC-hh		HE-LHC	HL-LHC	LHC
collision energy cms [TeV]	100		27	14	14
dipole field [T]	16		16	8.33	8.33
circumference [km]	97.75		26.7	26.7	26.7
beam current [A]	0.5		1.1	1.1	0.58
bunch intensity [10^{11}]	1	1	2.2	2.2	1.15
bunch spacing [ns]	25	25	25	25	25
synchr. rad. power / ring [kW]	2400		101	7.3	3.6
SR power / length [W/m/ap.]	28.4		4.6	0.33	0.17
long. emit. damping time [h]	0.54		1.8	12.9	12.9
beta* [m]	1.1	0.3	0.25	0.15 (min.)	0.55
normalized emittance [μm]	2.2		2.5	2.5	3.75
peak luminosity [$10^{34} \text{ cm}^{-2}\text{s}^{-1}$]	5	30	28	5 (lev.)	1
events/bunch crossing	170	1000	800	132	27
stored energy/beam [GJ]	8.4		1.3	0.7	0.36

Working hypothesis for HE LHC design:

No major CE modifications on tunnel and caverns

- Similar geometry and layout as LHC machine & experiments
- **Maximum magnet cryostat diameter ~1200 mm**
- **Maximum QRL diameter ~830 mm**

Integration and design strategy:

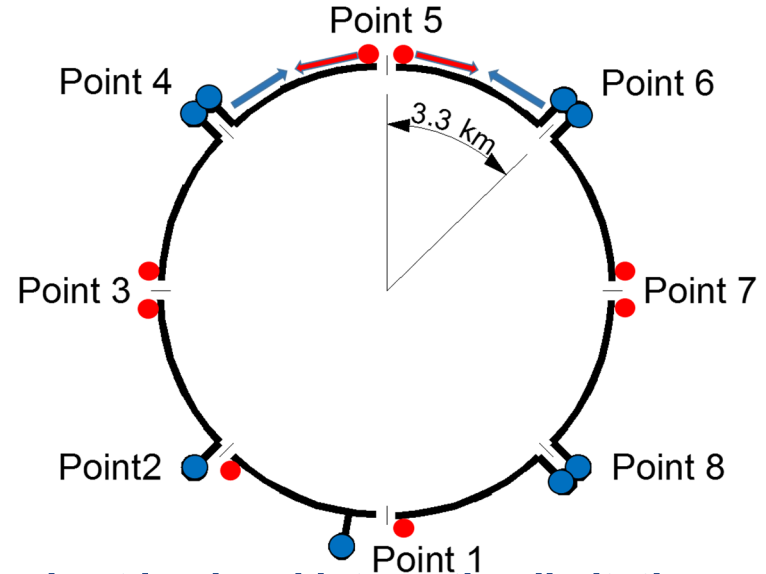

- Development of optimized 16 T magnet, compatible with HE LHC requirements
- New cryogenic layout to limit QRL dimension

- Coil optimization and margin 18 → 14%
- Inter-beam distance 250 → 204 mm
- Stray-field < 0.1 T at cryostat

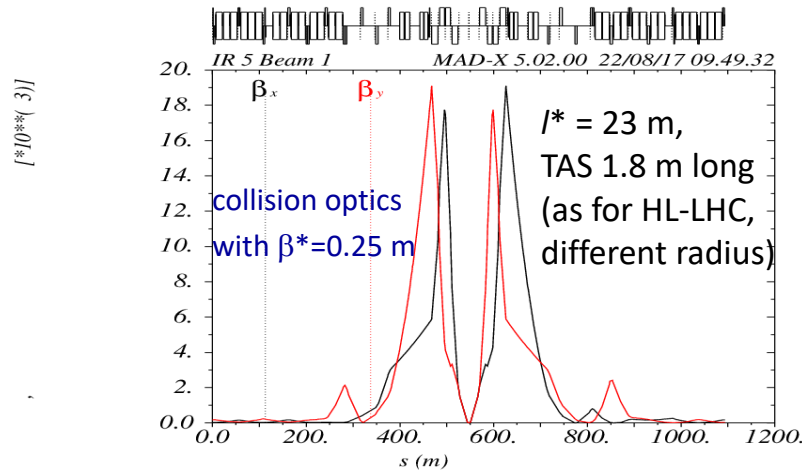

Half-sector cooling instead of full sector (as for LHC) to limit cross section of cryogenic distribution line

higher heat load and integration limitations:

- 8 additional 1.8 K refrigeration units wrt. LHC
- 8 new higher-power 4.5 K cryoplants

- **triplet lengths: HE-LHC: 56 m** (13.5 TeV)
- HL-LHC: 41.8m, present LHC: 30.4 m
- ca. 11 m space for crab cavities
- Triplet quadrupole design with 2 cm inner tungsten shielding
- For 10 ab⁻¹ integral luminosity: ~40 MGy peak dose (peak at Q3 can be reduced with shielding)

General optics design work ongoing for HE LHC with focus on injection (energy), field quality, physical & dynamic aperture, protection.

- circumference 97.8 km
- two high-luminosity experiments (A & G)
- two other experiments (L & B) combined with injection upstream of experiments
- two collimation insertions
 - betatron cleaning (J)
 - momentum cleaning (F)
- Extraction/dump insertion (D)
- RF insertion (H)
- integrated optics for full ring established, beam dynamics studies confirm design goals

Phase 2: Interplay of radiation damping, luminosity burn-off, controlled transverses blow-up

phase 1:

$\beta^* = 1.1 \text{ m}$, $\Delta Q_{\text{tot}} = 0.01$, $t_{\text{ta}} = 5 \text{ h}$
250 fb⁻¹ / year

phase 2:

$\beta^* = 0.3 \text{ m}$, $\Delta Q_{\text{tot}} = 0.03$, $t_{\text{ta}} = 4 \text{ h}$
1 ab⁻¹ / year

**Transition via operation experience,
 no HW modification**

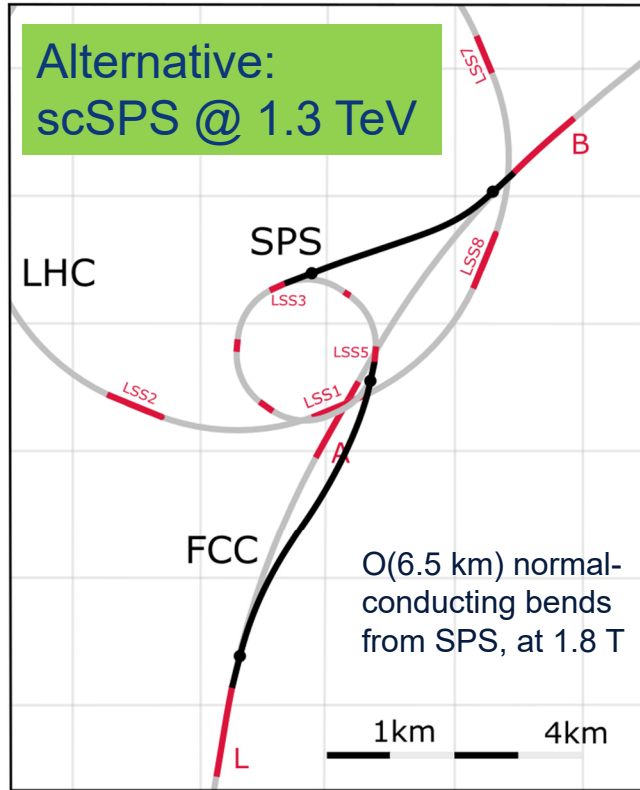

**Total integrated luminosity over
 25 years operation:
 O(20) ab⁻¹/experiment
 consistent with physics goals**

FCC-hh injector options and transfer lines

Baseline:
LHC @ 3.3 TeV

Alternative:
scSPS @ 1.3 TeV

Current baseline:

- Injection energy 3.3 TeV LHC
- Field-swing FCC-hh like LHC

Alternative options:

- Injection from SPS_{upgrade} around 1.3 TeV
- SPS_{upgrade} could be based on fast-cycling SC magnets, 6-7T, ~ 1T/s ramp, cf. SIS 300 design
- SPS_{upgrade} would also be an ideal injector for HE LHC (as alternative to the 450 GeV SPS)

Worldwide FCC Nb₃Sn program

Main development goal is wire performance increase:

- J_c (16T, 4.2K) > 1500 A/mm² → 50% increase wrt HL-LHC wire
- Reduction of coil & magnet cross-section

After only one year development, **prototype Nb₃Sn wires from several new industrial FCC partners already achieve HL-LHC performance**

Conductor activities for FCC started in 2017:

- Bochvar Institute (production at TVEL), **Russia**
- KEK (Jastec and Furukawa), **Japan**
- KAT, **Korea**
- Columbus, **Italy**
- University of Geneva, **Switzerland**
- Technical University of Vienna, **Austria**
- SPIN, **Italy**
- University of Freiberg, **Germany**

In addition, agreements under preparation:

- Bruker, **Germany**
- Luvata Pori, **Finland**

Short model magnets (1.5 m lengths) will be built from 2018 – 2022
Russian 16 T magnet program launched by BINP recently.

Iron Laminations

AL I-Clamps

StSt Skin

End Plates

Fillers

Axial Rods

- All coil parts, structural components and tooling are available at FNAL
- Coil fabrication and the work with mechanical structure are in progress
- First magnet test in September 2018

First ERMC coil winding

Aluminum shell

Magnet yoke

Coil fabrication

- Winding of the first coil has been completed
- Preparation for reaction on-going
- All tooling for coil production ready

Magnet assembly

- components and tooling ready
- Dummy assembly to characterize the structure behavior on-going.

Coil Reaction Tool

Coil Impregnation Tool

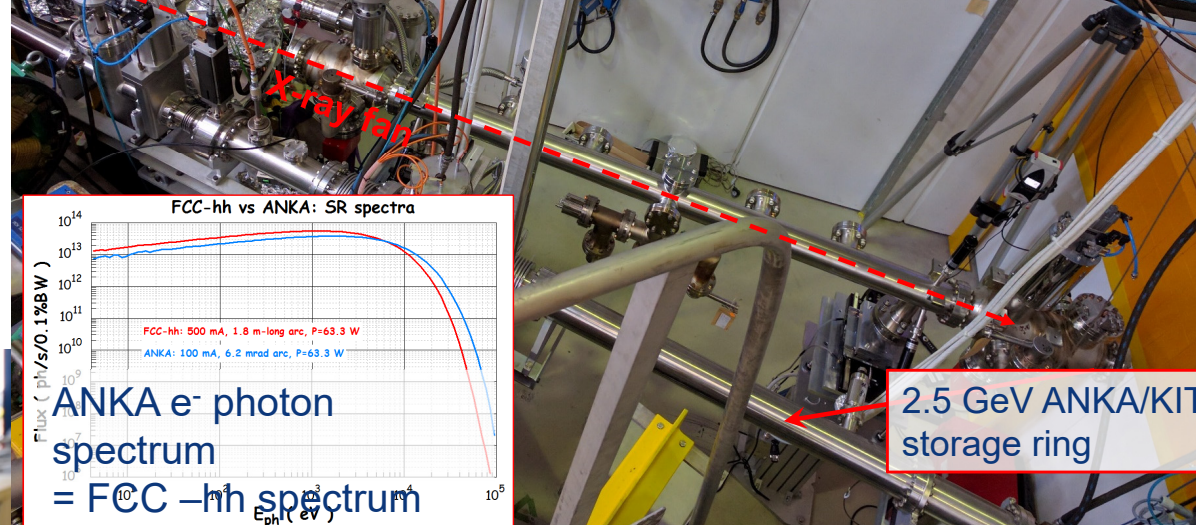

Dummy coils

Axial rods

synchrotron radiation ($\sim 30 \text{ W/m/beam}$ @16 T field) (cf. LHC $<0.2 \text{ W/m}$) $\sim 5 \text{ MW}$ total load in arcs

- **absorption of synchrotron radiation at higher temperature ($> 1.8 \text{ K}$)** for cryogenic efficiency
- provision of beam vacuum, suppression of photo-electrons, electron cloud effect, impedance, etc.

Cryoplants – energy efficiency

BS temperature choice is overall optimisation of:

- Cryoplant power consumption
- Vacuum system performance
- Impedance and beam stability

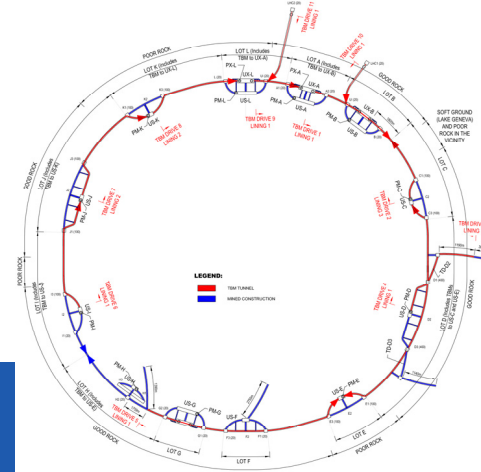

- Optimum beam screen operation temperature 40 - 60 K
- Electrical power for beam screen cooling $\sim 100\text{ MW}$.

Present baseline position was established considering:

- lowest risk for construction
- fastest and cheapest construction
- feasible positions for large span caverns (most challenging structures)

next step: review of surface site locations and machine layout

FCC-ee **FCC-hh**
5.5 m inner diameter

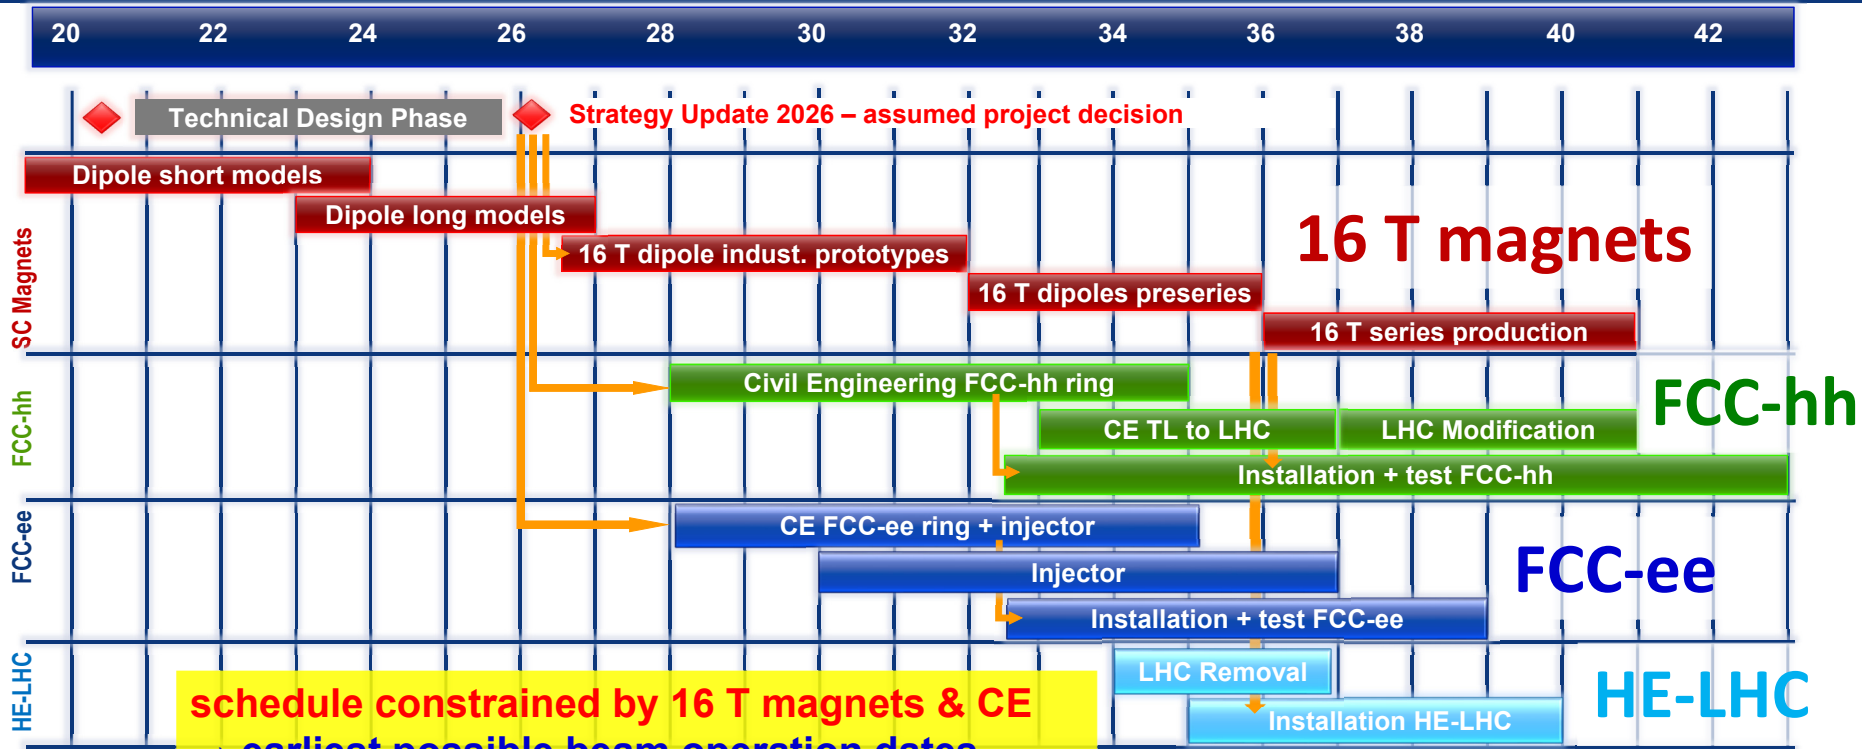

CE schedule studies

- Total construction duration 7 years
- First sectors ready after 4.5 years

Technical Schedule for each of the 3 options

schedule constrained by 16 T magnets & CE
 → earliest possible beam operation dates

- FCC-ee: 2039
- FCC-hh: 2043
- HE-LHC: 2040 (with HL-LHC stop LS5 / 2034)

Conclusions

- The FCC study focuses on high-performance energy frontier circular colliders for the post-LHC era
- Baseline machine designs established with performance matching the demanding physics requirements
- Present focus is on completion of the conceptual design reports as input for European Strategy update
- Worldwide R&D programs in place on Nb₃Sn superconductor, high-field magnets and highly-efficient SC RF
- International FCC collaboration is growing steadily, there are many R&D opportunities and all the community is invited to join
