TRIUMF

Outline

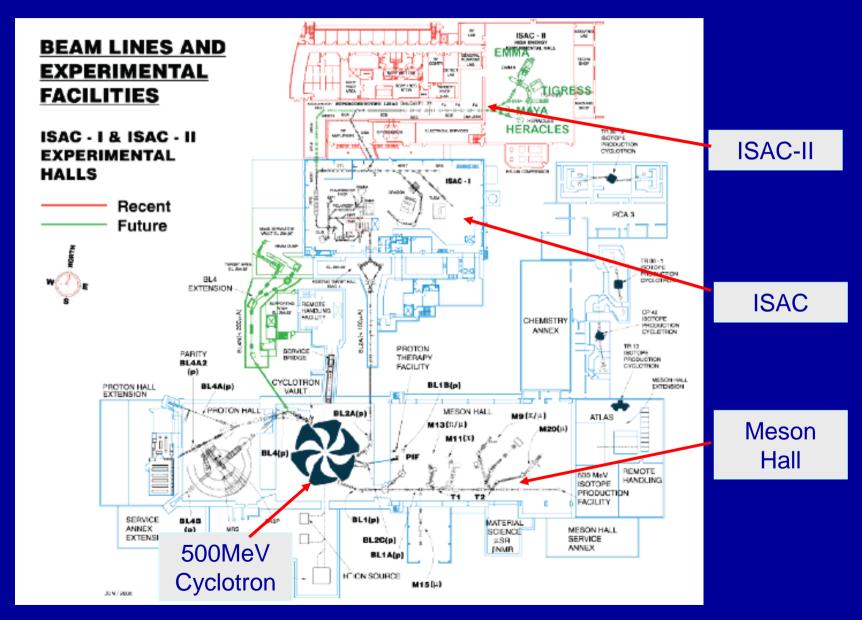

Outline:

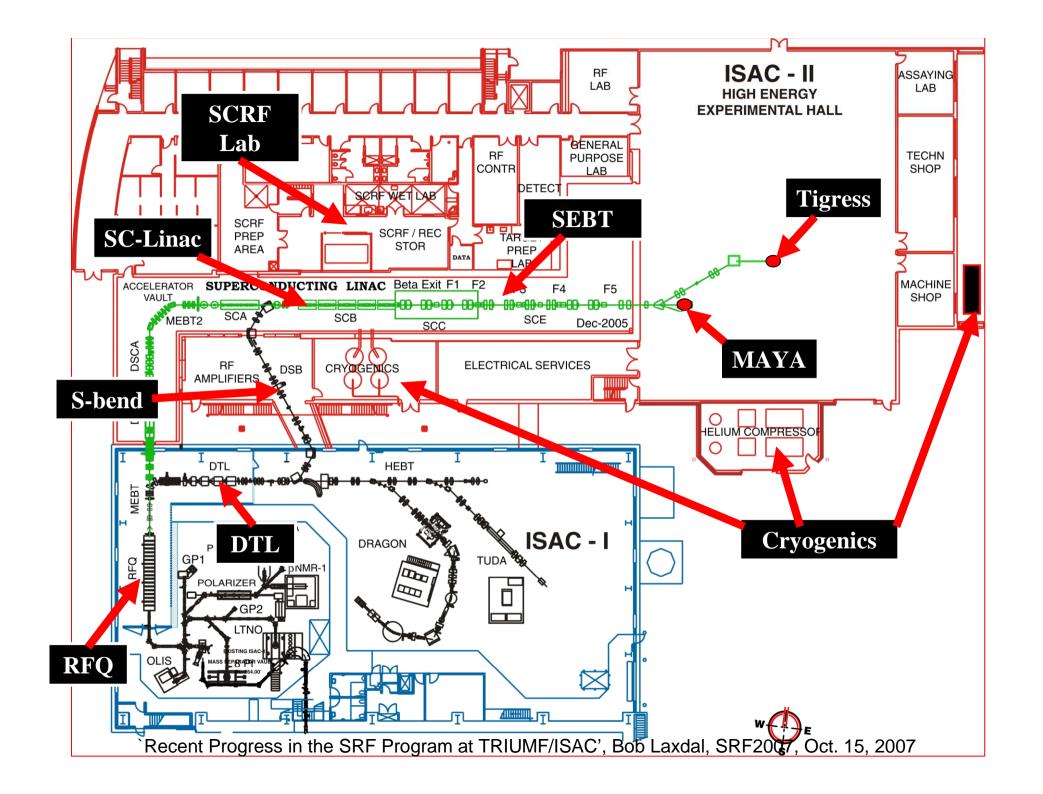

- ☐ ISAC-II Superconducting Heavy Ion Linac
 - ISAC-II design and goals
 - Operating experience
- Present initiatives
 - $\blacksquare \beta$ =0.11 Cavity prototyping
- ☐ Future plans
 - ■Upgrade to 1.3GHz
 - Proposal for e-Linac

Canada's National Laboratory for Particle and Nuclear Physics

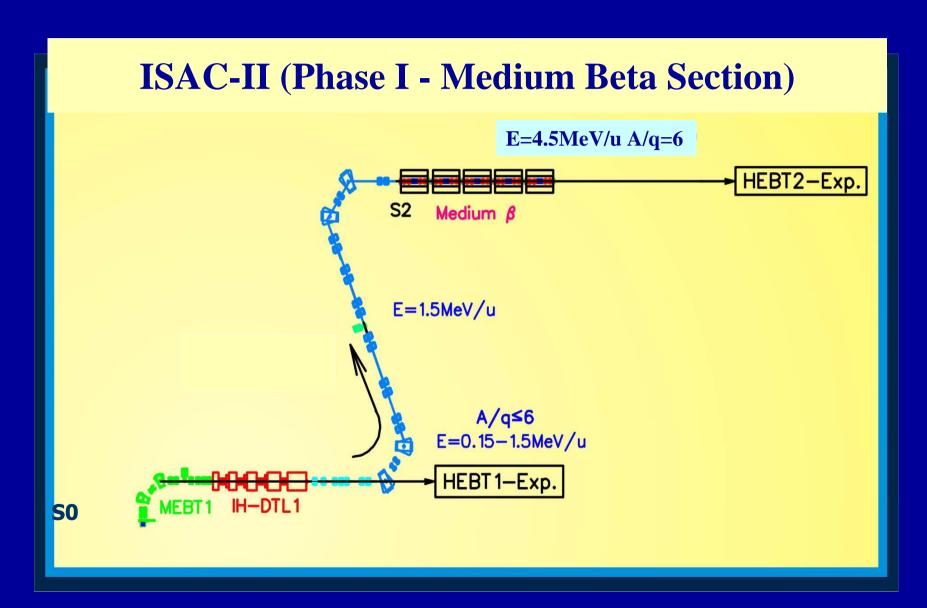

ISAC-II Design and Goals

ISAC-II Linac

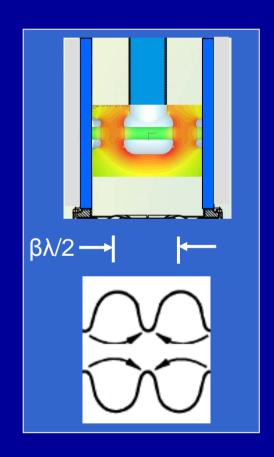

ISAC-II Linac

Design Goal

Low beta (0.1) vs High beta (1) performance

- E_{peak} at design P_{cav} gives a physical parameter that can be useful in comparing cavity performance
 - Typically E_{peak}/E_a =4-5 for low beta QWR's while E_{peak}/E_a ~2 for elliptical cavities.)
- For CW machines performance limited by LHe consumption - P_{cav} (Q at operating point) and not maximum achievable gradient (Cornell Ea~15-20MV/m for elliptical cavities or Ep~30-40MV/m)
- TRIUMF's goal for ISAC-II linac is to operate cw with Ep≥30MV/m (Ea≥6MV/m)

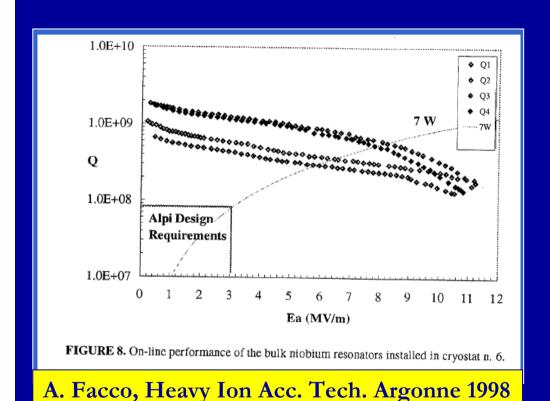

ISAC-II Linac

Design Goal

Bulk Niobium Cavities at LNL

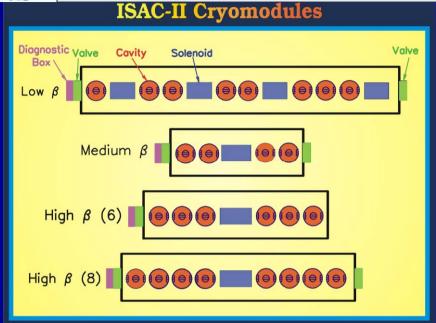

- •Performance over 6MV/m (Ep=30MV/m) demonstrated
- Difficult to lock
 - •unstable Alpi cryogenic system produces helium pressure fluctuations - tuner can't cope
 - •Rf auxiliaries (coupling loops, amplifiers, cables) undersized to provide sufficient bandwidth
 - •Alpi optics not compatible with high gradient

ISAC-II Linac: Medium β cavities

Prototype Cavity

Medium Beta Cavities (a) Nominal (β =7.1%) (b) Flat (β =5.7%) freq=106.08MHz $E_{\rm p}/E_{\rm a} \simeq 5$ $H_p/E_a \simeq 100 \text{ G/(MV/m)}$ $U/E_a \simeq 0.09J/(MV/m)^2$ $\Gamma \simeq 19\Omega$

`Recent Progress in the SRF Program at TRIUMF/ISAC', Bob Laxdal, SRF2007, Oct. 15, 2007

ISAC-II

Toward Higher Gradient

General Considerations

- Higher stored energy, U_o
 - Overcoupling used to broaden natural bandwidth
 - Requires P_{forward}=π U_oΔf_{1/2}
 - Increase amplifier, cables and coupling loop rating
 - Eigenfrequency excursions, ∆f, from microphonics (fast) and helium pressure fluctuations (slow)
 - Adopt accurate constanttracking tuner
- Higher peak surface field
 - Clean surfaces to reduce field emission, raise Q
 - Clean assembly techniques
- Higher rf defocussing fields (at ϕ_s =-25deg)
 - Adopt strong focussing lattice

ISAC-II

- Choose Ep=30MV/m
 - dV=1.1MV/cavity, Ea=6MV/m
 - Uo=3.2 Joules
 - P_{forward}=200W gives
 Δf=±20Hz
 - ✓ Amplifier and cables compatible with 800W
 - ✓ Loop compatible with P_{forward}=250W
 - ➤ ✓ New fast tuner developed
- **☑** Clean room assembly
 - Single vacuum space for insulating vacuum and beam
- - Solenoid complete with `bucking' coil to reduce fringe field in cavity region.

ISAC-II Linac: RF Systems

□RF power

- ➤ Provide useable bandwidth by overcoupling
- ightharpoonup Require P_f =200W at cavity for f $_{1/2}$ =20Hz at E_a =6MV/m, β =200

□Coupling loop

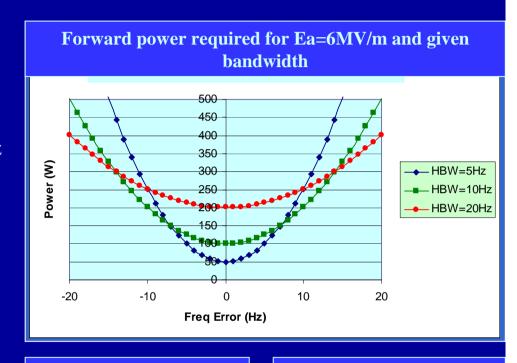

- ➤ Developed LN2 cooled loop
- > <0.5W to LHe for P_f=250W

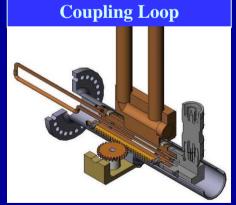

☐ Mechanical tuner

➤ Precise (0.3~Hz), fast (>50Hz/sec) tuner with dynamic range of 8kHz and coarse range of 32kHz

☐ Tuning plate

> Spun, slotted, `oil-can' tuning plate to improve tuning range

ISAC-II Linac: Cryomodule

- \square 2x2x1m stainless steel box vacuum vessel
- □LN2 cooled copper sheet used as thermal shield
- ■Mu metal between vacuum tank and LN2 shield
- □Cold mass suspended from lid on three adjustable support pillars

- □ Four cavities Ep=30MV/m
- □One SC solenoid @ 9T
- $\overline{\Box}V_{\text{eff}}=4.3\text{MV}$
- ☐ Single vacuum for thermal insulation and rf

Lid Assembly in Assembly Frame

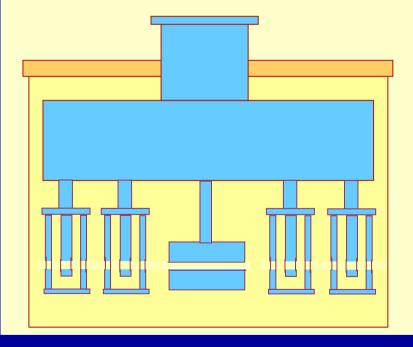

ISAC-II Cryomodule Vacuum

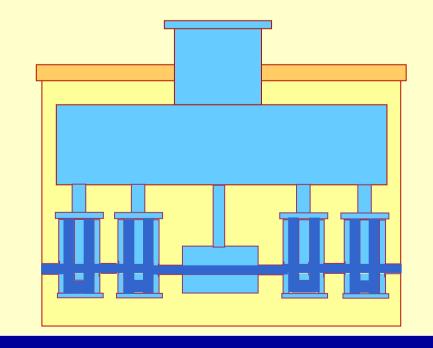

Single Vacuum vs Double Vacuum

- •Cavity vacuum and thermal isolation vacuum share the same space
- •Engineering easier but thermal vacuum must be done carefully (particulate control)
- •ISAC-II, ATLAS, Legnaro, JAERI

- •Cavity vacuum connected through beam pipe and isolated from thermal vacuum
- •Engineering more complex but eases cleanliness requirements in thermal vacuum space
- •RIA, SPIRAL-II, SOREQ

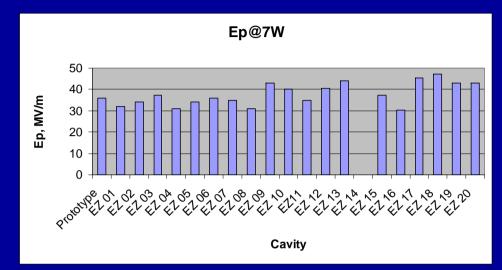

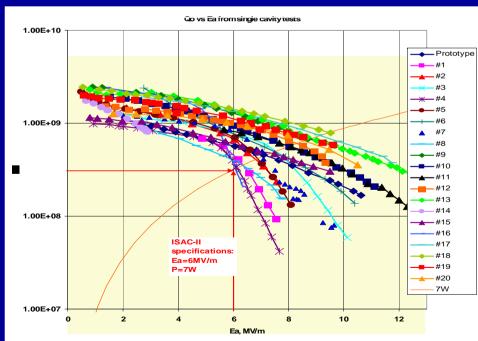

Operating Experience

ISAC-II Linac: Single Cavity Performance

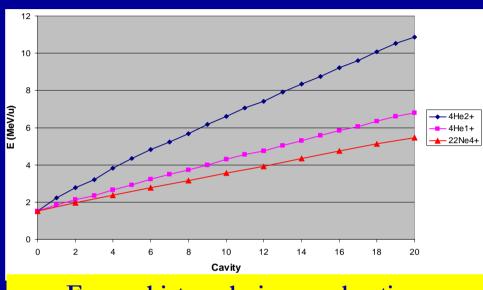

- Cavities tested initially in single cavity cryostat
- Four cavities retested with fast cooldown to reduce effects of Qdisease
- •Average peak surface field at operating power of 7W is now Ep=38MV/m corresponding to a voltage gain of 1.4MV/cavity and a magnetic field of Bp=75mT and a gradient Ea=7.5MV/m.
- •All cavities have been tuned to the ISAC-II frequency
- •One cavity (spare) quenches at Ep=15MV/m

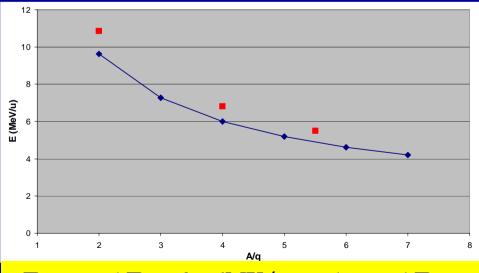

ISAC-II Linac: Commissioning

Energy history during acceleration.

Expected E_{final} for 6MV/m and actual E_{final}

Commissioning beams

- \cdot A/q=5.5 (22Ne4+)
- •A/q=4 (40Ca10+, 20Ne5+, 12C3+, 4He1+)
- A/q=2 (4He2+)

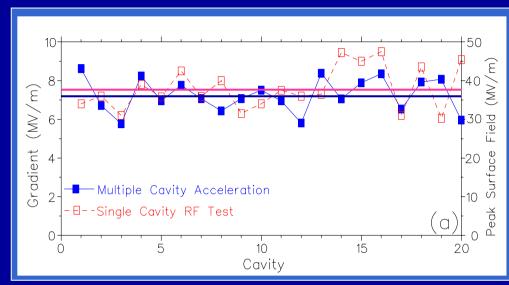

Performance

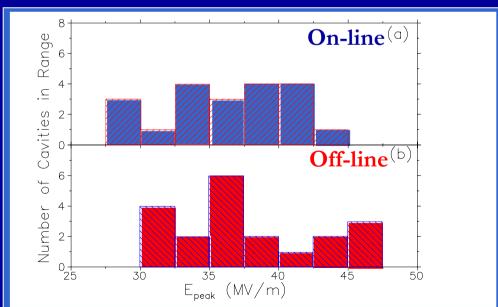

- •Power @ 7W/cavity
- •Design gradient is 6MV/m (Ep=30MV/m)
- •Average gradient is 7.2MV/m (Ep=36MV/m)
- •Final energy is 10.8, 6.8 and 5.5MeV/u for A/q=2, 4, 5.5 respectively
- •Transmission >90%

Cavities: On-line vs. Off-line Performance

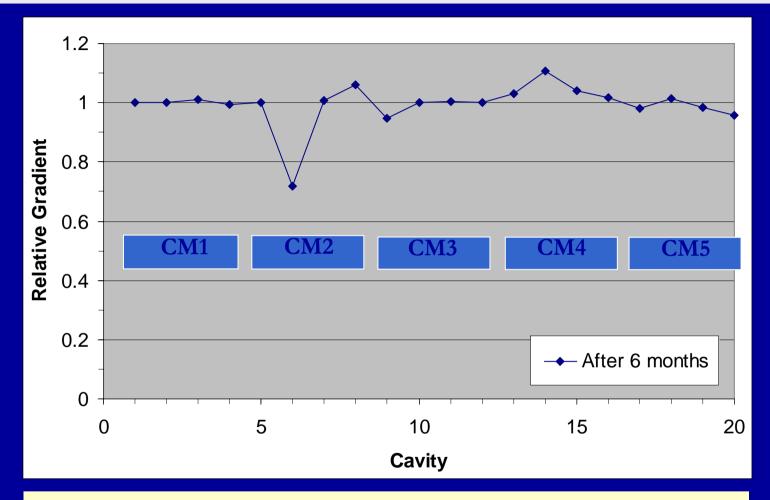

- •On-line gradients calculated from beam acceleration at 7W/cavity averaged over three different ions. The average gradient for the on-line cavities is 7.2MV/m corresponding to a peak surface field of 36MV/m
- •Off-line results give an average gradient at 7W/cavity of 7.6MV/m corresponding to Ep=38MV/m
- •Some contamination evident in a few cavities but on-line performance down by only 5% from off-line tests

ISAC-II Linac: Relative Gradient

Average gradient (@7W) down by only 1% in the first six months compared to initial gradients.

•Cavity CM2:CAV2 has modest reduction in performance due to Q-disease

ISAC-II Linac: Shutdown Work

- •The linac was warmed up Jan. 19, 2007 during the cyclotron annual shutdown. Job list included:
 - •Remove CM1 to the clean room for repair of the coupling loop drive and replacement of a turbo-pump
 - •Replace three other turbopumps *in situ* using `clean' procedure (no explanation to date for high failure rate)
 - •Vent with filtered dry nitrogen, construct plastic barrier, ...
 - •Results were a surprise

ISAC-II Linac: Shutdown Work

Varian 550 turbo-pump on CM4 suffered catastrophic falure!

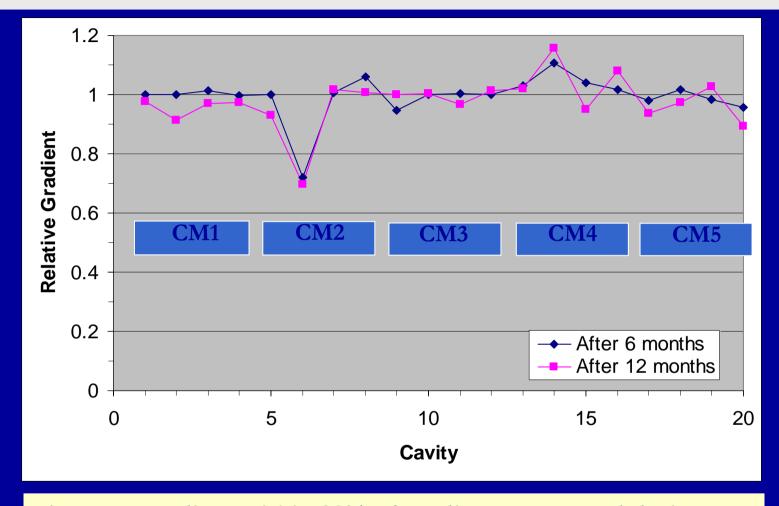

There was no time for taking the cryomodule off-line for cleaning so we removed the fragments that we could reach, vacuumed the LN2 shield, pumped down and crossed our fingers.

•Remember that cavity vacuum shares isolation vacuum

ISAC-II Linac: Relative Gradient

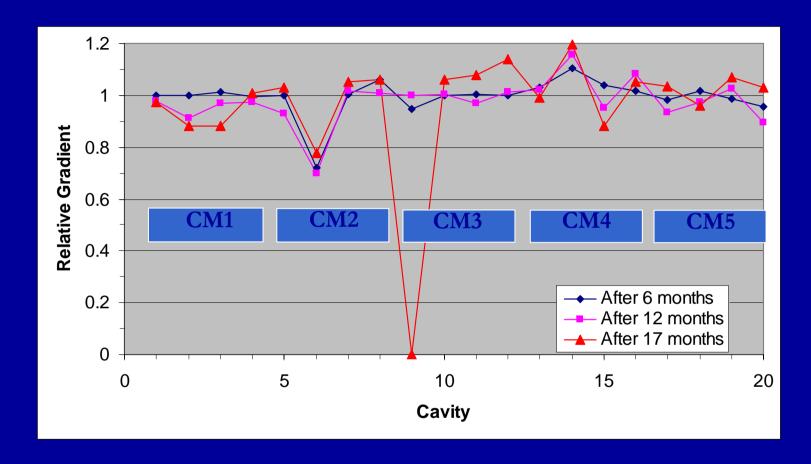

- •Average gradient within 98% of gradients measured during first commissioning.
 - •No deterioration due to shutdown activities

ISAC-II Linac: Relative Gradient

- •One cavity failed in the last running period due to an open connection in the cryomodule vacuum space
 - •No deterioration in gradient performance over the run

ISAC-II Linac: First Experiments

Initial Beam Delivery

- Seven weeks of beam time
 - 1100 hours scheduled
 - 825 delivered (75% availability)
 - Includes availability of driver, target, linear accelerators and procedures
 - ISAC-II Linac downtime 36 hours (3%)
 - 16 hours cryogenics
 - 20 hours ISAC-II rf
 - One cavity inoperable requires retune 10 hours
 - Five amplifier tubes required replacement
 - » All are now replaced (see Amiya Mitra poster

ISAC-II Linac: Performance

CW heavy ion SC-linacs with Nb technology

- ATLAS
 - Bulk niobium Ep~15-20MV/m
- INFN-Legnaro
 - Sputtered Nb on Cu (former Pb) Ep~22MV/m
 - Bulk niobium cavities higher gradients demonstrated but little on-line experience
- JAERI
 - Explosively bonded Nb on Cu Ep~25MV/m
- ISAC-II
 - Bulk niobium cavities Ep=35MV/m

SRF Facilities

SRF@TRIUMF - Capability

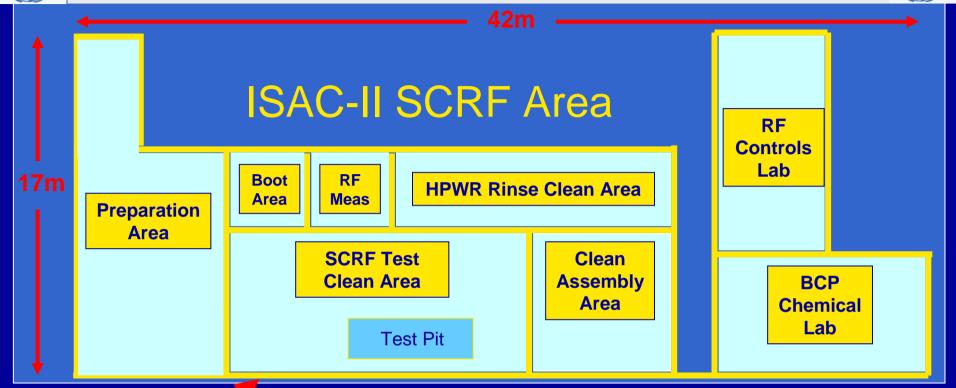

- Clean room (500m^2)
 - Overhead crane, rf test pit (4mx1.5mx2.5m)
 - Single cavity and Cryomodule assembly area
- High Pressure Water Rinse (HPWR)
 - 18MOhm water, high pressure pump
- BCP etching
 - Pre-weld etch facility now operational
 - Full cavity etch facility being prepared
 - Ready by end of 2007
- 100-140MHz rf test equipment
- Helium distribution lines from present refrigerator (Phase I) with return to cold box for closed cycle operation
- Trained technicians and engineers

SRF@TRIUMF: Infrastructure

- ISAC II HIGH ENERGY EXPERIMENTAL HALL ISAC - I & ISAC - II EXPERIMENTAL Existing Recent
- •The ISAC-II building houses the SCRF test and assembly areas
 - •~ 500m² of floor space, overhead crane
 - •Ultrasound cleaning tanks, HPWR area, shielded rf test area, cryomodule assembly area, BCP lab (in construction)
 - •Over 40 single cavity tests performed and five cryomodules assembled since 2004

SRF@TRIUMF: Infrastructure

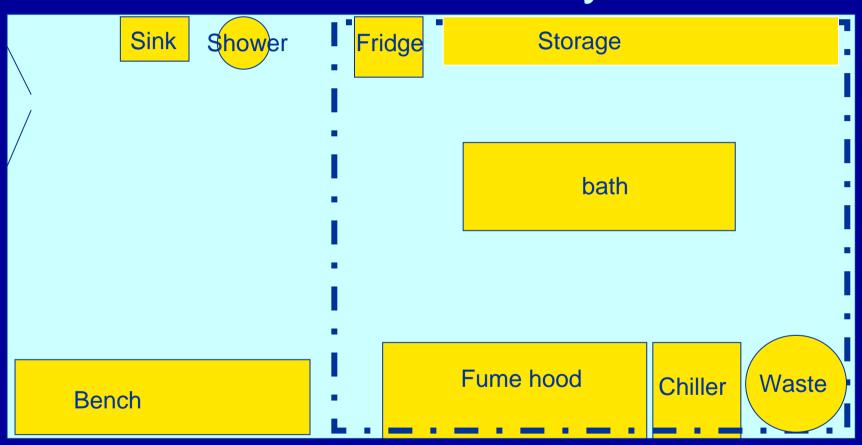

SRF@TRIUMF: Infrastructure

Chemical Lab Layout

•Layout and equipment compatible with processing TRIUMF quarter wave cavities, including future low beta cavity, or ILC nine-cell cavities.

`Recent Progress in the SRF Program at TRIUMF/ISAC', Bob Laxdal, SRF2007, Oct. 15, 2007

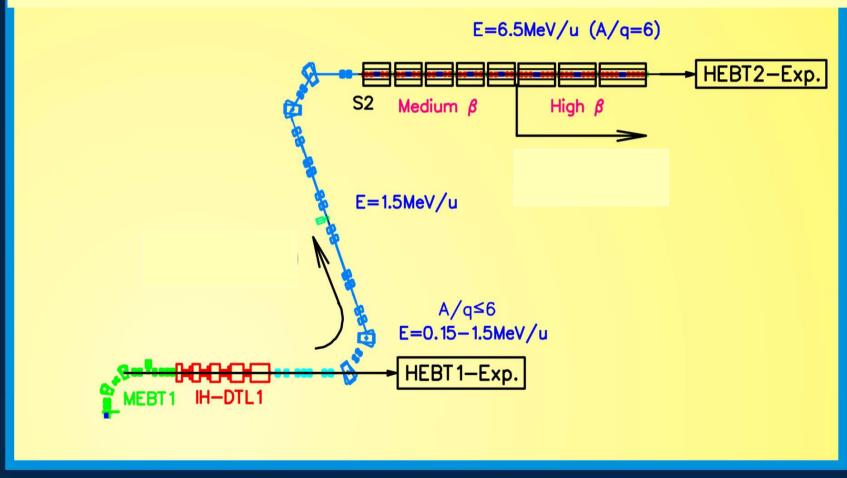

Present Developments

ISAC-II Linac-Future

SRF

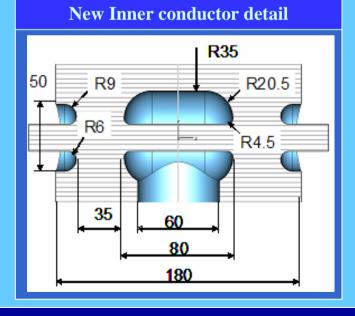

Present Developments

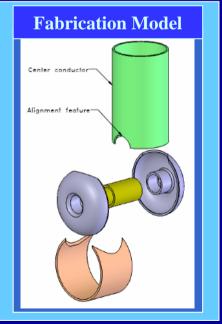

- High beta coupling loop
 - •Improved motor drive on coupling loop
- High beta cavity development
 - •Built two full scale models in copper at PAVAC with standard inner conductor
 - Modeling new inner conductor detail for high beta cavity with improved field shape

`Recent Progress in the SRF Program at TRIUMF/ISAC', Bob Laxdal, SRF2007, Oct. 15, 2007

SRF

Present Developments

Coupling loop development for high beta section

•Problem:

 Medium beta loop variable drive stiffens in some cavities during cooldown due to side loads

•Solution:

- •Cross roller bearings replace teflon guide bushing
- •Side loads from LN2 circuit reduced by using center feed
- Thermal tests confirmed design goals
 - Smoother travel
 - •<0.5W from loop to 4K at Pf=200W

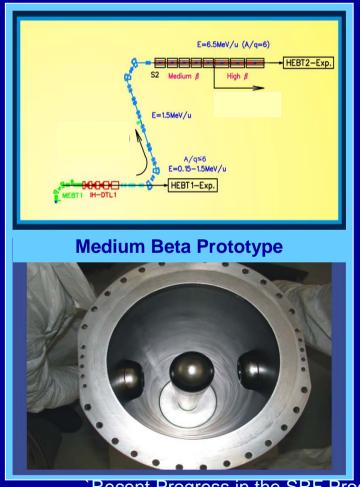

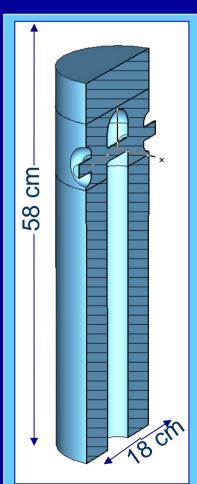

ISAC-II

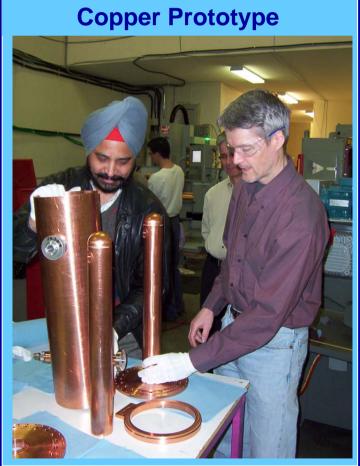

Beta=0.11 Cavity

- •The Phase-II Extension of ISAC-II calls for the addition of 20 `high beta' $(\beta=0.11)$ quarter wave cavities by the end of 2009
- •TRIUMF is presently prototyping two bulk niobium quarter wave cavities with a local company, PAVAC

Recent Progress in the SRF Program at TRIUMF/ISAC', Bob Laxdal, SRF2007, Oct. 15, 2007

PAVAC:

Local Fabricator

- Who is PAVAC?
 - A Canadian Company located in Richmond B.C.
- Specializing in
 - Electron Beam Welding
 - Pulsed Electron Beam Drilling and Surface-Micro Machining
 - Pulsed Electron Beam Coating (PEB-PVD)
- Presently fabricating two β=0.11 prototype cavities for testing by year end

Forming and Machining

EB Welding

Pre-weld Etching - TRIUMF

Future Developments

TRIUMF and the ILC

- •TRIUMF has now joined the Tesla Technology Collaboration (TTC)
- Possible roles for TRIUMF
 - Qualification of Pavac as a North
 American supplier of ILC elliptical cavities
 - •Production of several single cells and at least one nine cell elliptical cavity
 - Large grain and single crystal material, cavity tuners, LLRF
 - •Build in house expertise in electron accelerator technology by designing, fabricating and installing an accelerator based on electron technology

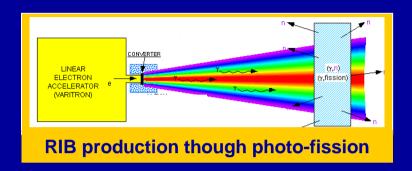

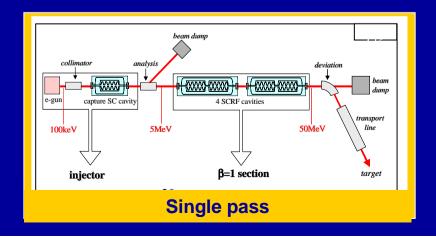

TRIUMF and Electrons

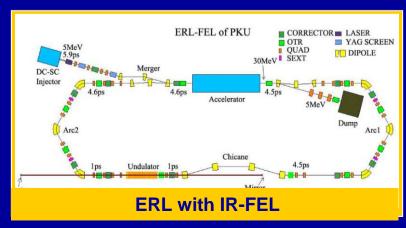

- •TRIUMF is discussing a proposal to build another RIB driver to compliment the capabilities of the 500MeV cyclotron
 - •A strong candidate for this driver is a high intensity SC electron linac (50MeV, 1-10mA) (50kW-0.5MW), single pass or double pass, to produce radioactive ion beams via photo fission
 - •Could be configured as an energy recovery linac (ERL) with an IR-FEL on the back straight section for accelerator studies

TRIUMF and Electrons

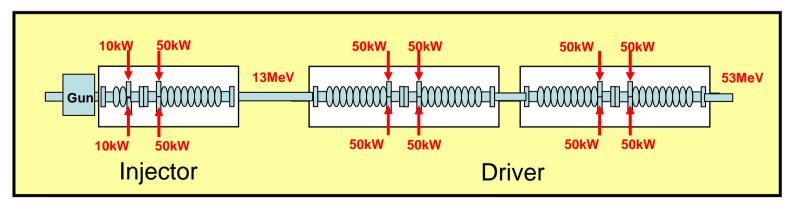

Parameters of E-Linac

Freq (MHz)	1300
Duty cycle	Cw
Cells/cavity	9
No. of cav	5
Grad (MV/m)	10
Cavity length (m)	1
R/Q	1000
Qo	1x10 ¹⁰
Pcav (W)	11

Energy (MeV)	53
Max I (mA)	10
Power/cav (kW)	100
Power/cplr (kW)	50
Qext	1x10 ⁶
Charge (pC/bunch)	7

Capture Cavity	
# cells	2
R/Q	200

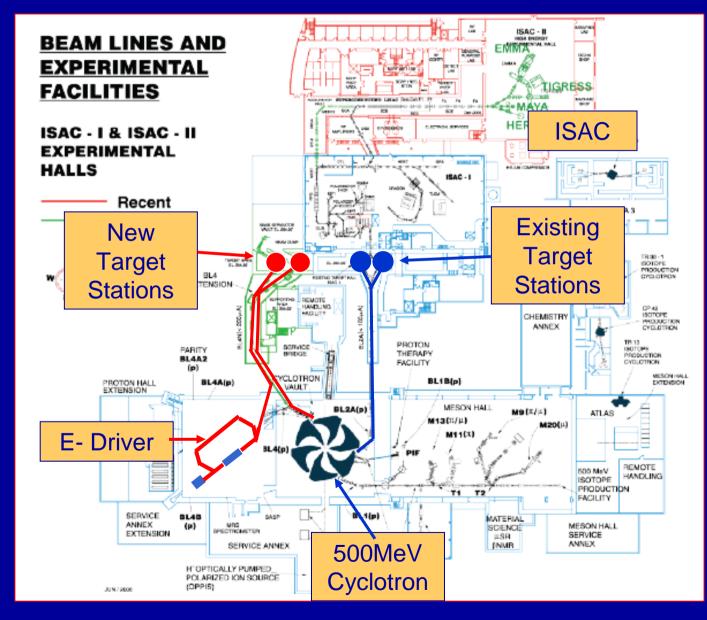

`Recent Progress in the SRF Program at TRIUMF/ISAC', Bob Laxdal, SRF2007, Oct. 15, 2007

TRIUMF and Photo-fission

Proposal:

- •BL4N is proposed to deliver 500MeV protons to up to three target stations for beam development and an additional RIB source for experiment
- •Take advantage of the shielded and unused proton hall to add an electron driver ring to supply electrons to the new target area via a separate beamline; three simultaneous RIB beams
- •Develop target stations in the new area dedicated to the use of actinide targets
- •Include a FEL source on the back straight to allow IR light source
- •TRIUMF/CLS Canadian collaboration for future light source

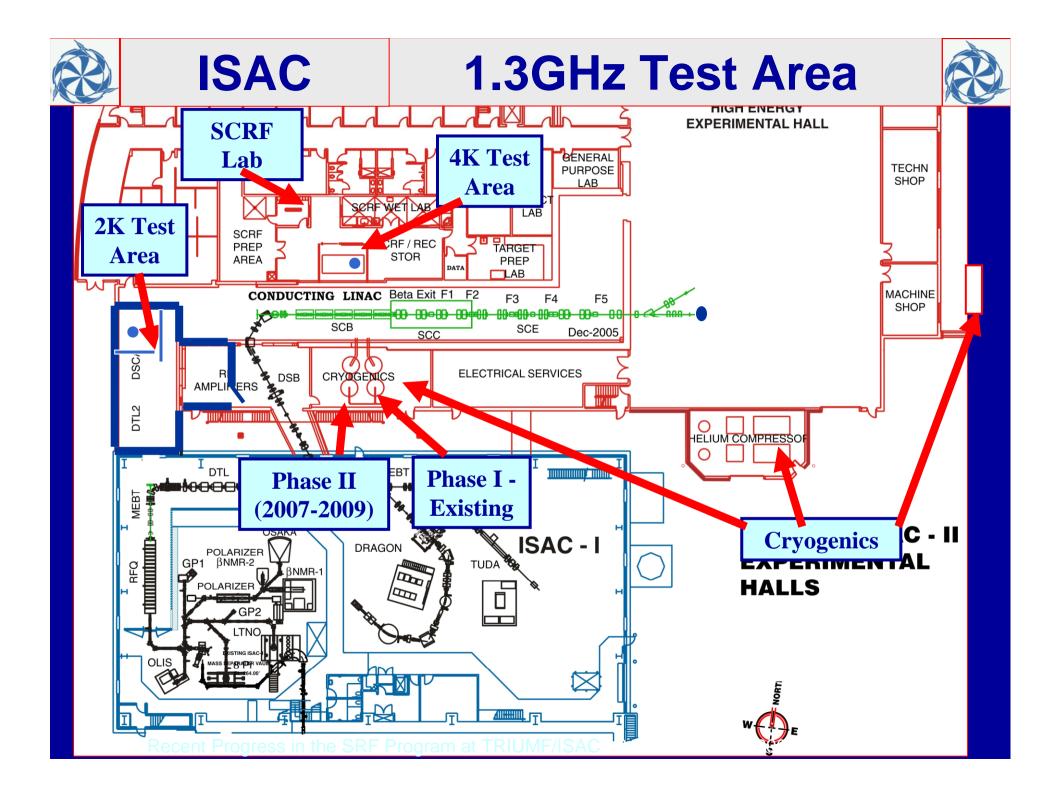

SRF@TRIUMF: 1.3GHz Upgrade

Require upgrade to present capabaility

- Vertical cryostat with bath insert for single cavity and nine cell cavity tests
- 1.3GHz test area clean room?
 - Overhead crane, shielded rf test bunker
 - Possible area in ISAC-II vault
- 2K cryo system
 - Phase II 500W 4K system will be available from 2007-2009 for cold tests
 - Require sub-atmospheric pumping system plus recovery/scrubbing system
 - Outside clean room
- 1.3GHz rf test equipment
 - LLRF control board
 - Amplifier
 - Test equipment
 - Signal generator, freq counter, Power meter, scope, spectrum analyzer
 - Ancillaries
 - cables, connectors, mixers, attenuators, phase shifters

SRF@TRIUMF: Conclusion

- ISAC-II Linac now operates cw at gradients corresponding to peak surface field of 35MV/m, the highest of any operating heavy ion facility
 - Gradients 20% above design specification and only 5% below single cavity test gradients
 - Little or no degradation over the 17 months of operation including first full warm-up
 - A single vacuum system does not preclude high performance operation in the cw regime (not strongly dominated by field emission)

Present

- Two prototypes for β=0.11 quarter wave cavities now in production in PAVAC for testing by year end
- Order for twenty production cavities placed in early 2008

Future

- SRF group tooling up for testing at 1.3GHz
 - Pursuing funding for a 50MeV e-linac as a RIB driver
 - Support TTC collaborations for ILC
 - Qualify PAVAC as North American vendor for ILC cavities
